Blood Cancer (Leukemia) Last Stage Report

Patient Details:

Name: Sohil Khan

Date of Birth: 05/08/1998

Report Date: 23/12/2024

Referring Doctor: Dr. Davendra Singh, MBBS

Clinical Summary:

The patient is a 26-year-old male diagnosed with acute leukemia (last stage), presenting with significant symptoms including severe fatigue, recurrent infections, uncontrolled bleeding, and weight loss. Bone marrow biopsy and blood tests indicate advanced disease progression with poor prognosis.

Laboratory Investigations:

1. Complete Blood Count (CBC):

Parameter: Result (Reference: Reference Range)

Hemoglobin (Hb): 6.5 g/dL (Reference: 13.0-17.0 g/dL)

Total Leukocyte Count (TLC): 250,000/µL (Reference: 4,000-11,000/µL)

Platelet Count: 15,000/µL (Reference: 150,000-450,000/µL)

Red Blood Cells (RBC): 2.1 million/µL (Reference: 4.7-6.1 million/µL)

2. Peripheral Blood Smear:

- Presence of blast cells: 85%

- Severe anisopoikilocytosis observed.

3. Bone Marrow Aspiration & Biopsy:

- Hypercellular marrow with >90% blasts.

- Complete suppression of normal hematopoiesis.

4. Liver & Renal Function Tests (LFT/RFT):

Test: Result (Reference: Reference Range)

Serum Creatinine: 2.3 mg/dL (Reference: 0.7-1.3 mg/dL)

ALT (SGPT): 72 U/L (Reference: 7-56 U/L)

Bilirubin (Total): 1.8 mg/dL (Reference: 0.1-1.2 mg/dL)

Diagnosis:

Acute Myeloid Leukemia (AML) - Final Stage

- Extensive blast infiltration in the bone marrow and peripheral blood.

- Severe anemia, thrombocytopenia, and leukocytosis.

Prognosis:

The disease has progressed to a terminal stage, with multi-organ involvement and extremely limited treatment options. Supportive palliative care is recommended for symptom management.
